SMGL was expanded to Cross River State in Nigeria in 2015, and has achieved substantial successes over just two years of programming. A key contributor to success in Nigeria is the linkage between public, private and faith-based facilities, as well as primary and secondary facilities, which has led to stronger referral systems and improved working relationships between service providers in each sector.

*Prior to SMGL, newborn deaths in Cross River State were often discounted. SMGL is emphasizing the importance of capturing all newborn deaths. In the short term, this will result in an increase in reported newborn mortality; in the long-run, with programming to improve maternity care, we anticipate a reduction in newborn deaths.

** Slight variations in values may be due to differences in rounding.
Maternal and Perinatal Health Outcomes Improve in Uganda SMGL-supported Districts

The district-level maternal mortality ratio (MMR), or the number of maternal deaths per 100,000 live births among all women residing in SMGL districts, is a key indicator of access and quality of obstetric services and is a measure of a country’s progress towards the Sustainable Development Goals. The MMR continued to decline in the four SMGL Learning Districts of Uganda.

In 2016, the MMR had declined by 44% compared to the level at the beginning of SMGL (from 452 to 255 deaths per 100,000 live births). The 11% annual rate of reduction in SMGL districts between baseline and endline is about 4.5 times higher than the annual reduction rate for Sub-Saharan Africa and 4 times higher than the annual reduction estimated for Uganda as a whole.

** Slight variations in values may be due to differences in rounding
In Zambia’s intervention districts, women who delivered in health facilities were monitored during labor, childbirth and the immediate postpartum period. This series of indicators reflects overall improvements in the facilities’ ability to deliver quality maternal and newborn care services after 5 years of SMGL implementation.
